How to protect your CNC system

1.We may need to connect one workstation with CNC machine via **RS232 connection**. (download code)

2.We need to have **serial port sharer** for multiple CNC to connect with workstation. (workstation just have one RS232 to connect and we don't need to change RS232 connection manually)

3.We need to have **GROUND isolated feature** between workstation and every CNC machine. (each CNC may have big ground bounce to burn your system)

4.We need serial port sharer with GROUND isolated feature in each RS232 connection. (S232io box can have **double GROUND isolated barrier** between master and slave RS232 serial port to protect your system)
